Meteorological Measurements and Instrumentation Giles Harrison 2014-10-14 This book describes the fundamental scientific principles underlying high quality instrumentation used for environmental measurements. It discusses a wide range of in situ sensors employed in practical environmental monitoring and, in particular, those used in surface based measurement systems. It also considers the use of weather balloons to provide a wealth of upper atmosphere data. To illustrate the technologies in use it includes many examples of real atmospheric measurements in typical and unusual circumstances, with a discussion of the electronic signal conditioning, data acquisition considerations and data processing principles necessary for reliable measurements. This also allows the long history of atmospheric measurements to be placed in the context of the requirements of modern climate science, by building the physical science appreciation of the instrumental record and looking forward to new and emerging sensor and recording technologies.

Appropriate for courses in Geography Instrumentation, Meteorological Measurements, Environmental Measurements, Principles of Atmospheric Measurements, or Environmental Instrumentation. It assumes a prerequisite introductory course in Atmospheric Science, Meteorology, or the equivalent. Introduces the fundamentals of field measurement by providing an up-to-date presentation of present and futuristic meteorological instruments and the measurements they make. It provides the reader with enough information to understand how these instruments operate, what to expect when making measurements with these instruments, and how to ensure the optimal performance of the devices.

A Treatise on Meteorological Instruments Joseph Zambra Henry Negretti 2019-11-21 The national utilisation of Meteorology in forewarning of storms, and the increasing employment of instruments as weather indicators, render a knowledge of their construction, principles, and practical uses necessary to every well-informed person. Impressed with the idea that we shall be supplying an existing want, and aiding materially the cause of Meteorological Science, in giving a plain description of the various instruments now in use, we have endeavoured, in the present volume, to condense such information as is generally required regarding the instruments used in Meteorology; the description of many of which could only be found in elaborate scientific works, and then only briefly touched upon. Every Meteorological Instrument now in use being fully described, with adequate directions for using, the uninitiated will be enabled to select those which seem to them best adapted to their requirements.
